

Based on the feedback from our Draft poster, we have made the following changes:

Method- We changed the wording in the method section of our poster to be simpler and easier to understand, removing some redundant lines and details.

Appropriate description of results with figures and table- We removed some of the wording in our results section, and included information that explained thresholds and effect size as well as percent variance for the PCA

Conclusion- explicitly added line specifying limitations in our study and our dataset used, specifically a lack of information regarding metadata for our dataset, resulting in several assumptions that needed to be made. We also streamlined the paragraph to summarize the findings in our discussion without being repetitive.

Accuracy, robustness, and efficiency of design- Code no longer uses normalized log transform data; we also changed the PCA to use the top 1000 genes instead of all genes to prevent noise. Ultimately, this didn't make a significant difference in the final plot.

Formatting and Asthetic - Made significant changes to our poster design to make it less congested, we removed the 'Abstract' and rearranged panels to visually flow better, we reduced the overall number of words and increased the font to make the poster easier to read as well.
